Future Medicine

More science fact than science fiction.

An on-going documentary series.

*Who would have dreamed a hundred years ago of open-heart surgery or even X-rays?
Now imagine what the future of medicine holds for us?*

Future Medicine explores where medicine is going and what fantastic feats it may accomplish during this century and beyond. The series fascinates viewers with the power and possibility of medical technology. From robotics to telesurgery, from computer chip brain implants to homes that monitor us for illness, the future of medicine is packed with potential to Wow, Amaze and Heal.

Future Medicine shows viewers today what's possible tomorrow. We tell our stories through the eyes of medical visionaries, scientists and futurists. Their miracle research may make the blind see and the lame walk.

Filmed throughout the world, *Future Medicine* looks like science fiction, but it's based on science fact.

Ep#1 – Future Surgery

Future Surgery explores three technologies that are revolutionising how surgeons perform operations and deliver critical care. Telementoring and Robotic Surgery are technologies that promise to bring specialised health care to remote regions along with decreasing the chance of human error. The Gamma Knife is a new technology that promises an alternative to invasive brain surgery. In Future Surgery, we see how advances in surgical tools promise to bring gentler and more effective treatments to all corners of the earth.

Ep#2 – Bio-Medicine

Bio-Medicine explores the new ways in which medical researchers are turning to nature and the human body to provide medical cures. This episode explores how researchers are attempting to replicate new organs, growing and harvesting pharmaceuticals from common plants and farm animals and transferring much-needed islet cells to diabetics. Bio-Medicine explores how current technology makes use of the world around us to provide cures for the diseases that ail us.

Ep#3 – Body-Machine Interface

The Body-Machine Interface explores the ways in which mechanical technology will interact with the human body in order to combat disease and illness. Nanotechnology offers the possibility of using microscopic machines to combat internal illnesses. Cyborg Technology offers the hope of melding broken bodies to machines so as to provide mobility to people suffering paralysis. 3D Technology, an essential tool for doctors at the vanguard of surgical treatment, provides an unparalleled view into the human body. Body-Machine Interface examines the ways in which man and machine will become intertwined in the medicine of the future.
